Parallel Mechanism (Manipulator)

- **Closed loop mechanism** in which the **end-effector** is connected to the base by at least **two independent kinematic chains**

Kinematic chains:

Coupling of links via kinematic pairs

Delta robot [80]

Parallel vs. Serial Manipulators

Delta robot

Puma robot

	Parallel manip.	Serial manip.
Kinematic chain(s)	Closed	Opened
Workspace	Limited	Large
Accuracy	Good	Low
Payload	High	Low
Stiffness	High	Low

Aspect Computation

- **Parallel manipulators** may have multiple inverse and direct kinematic solutions
 - A given end-effector pose
 - several control inputs
 - A given control input
 - several end-effector poses
- **Domain with multiple solutions contains singular solutions**
- **Aspect** [Chablat, 2007]:
Maximal singularity-free region within the domain
- ➔ Our aim: **Rigorous computation of aspects**

Example: 2-RPR Manipulator

- Inputs:

- Variables

- ▶ Control Variables: u_1, u_2
 - ▶ Pose Variables: x_1, x_2

- Initial domain:

- $u_1 \in [2, 6], u_2 \in [3, 9],$

- $x_1, x_2 \in [-20, 20]$

- Model:

$$f(u, x) = \begin{pmatrix} u_1^2 - (x_1^2 + x_2^2) \\ u_2^2 - ((x_1 - 9)^2 + x_2^2) \end{pmatrix} = 0$$

Example: 2-RPR Manipulator

- Inputs:

- Variables

- ▶ Control Variables: u_1, u_2
- ▶ Pose Variables: x_1, x_2

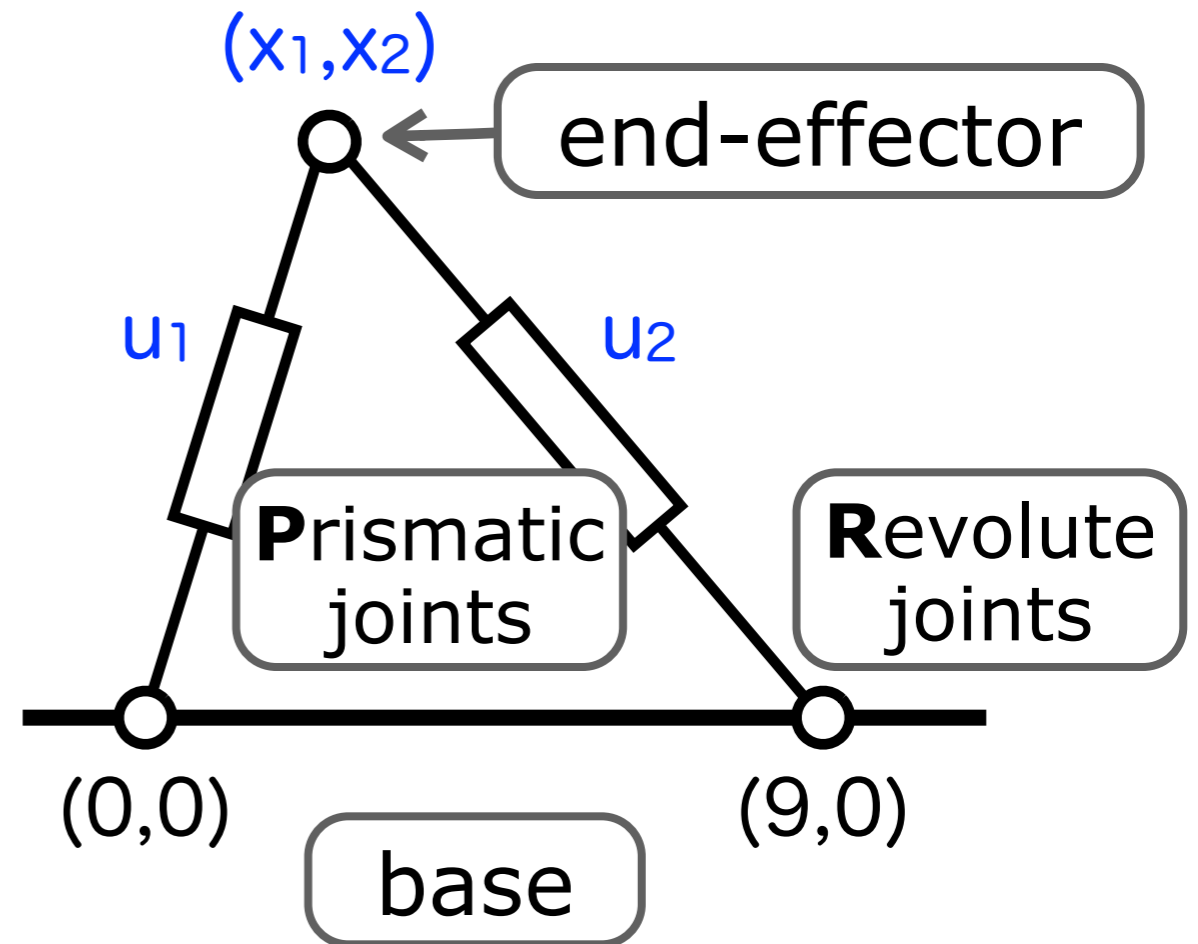

- Initial domain:

$$u_1 \in [2, 6], u_2 \in [3, 9],$$

$$x_1, x_2 \in [-20, 20]$$

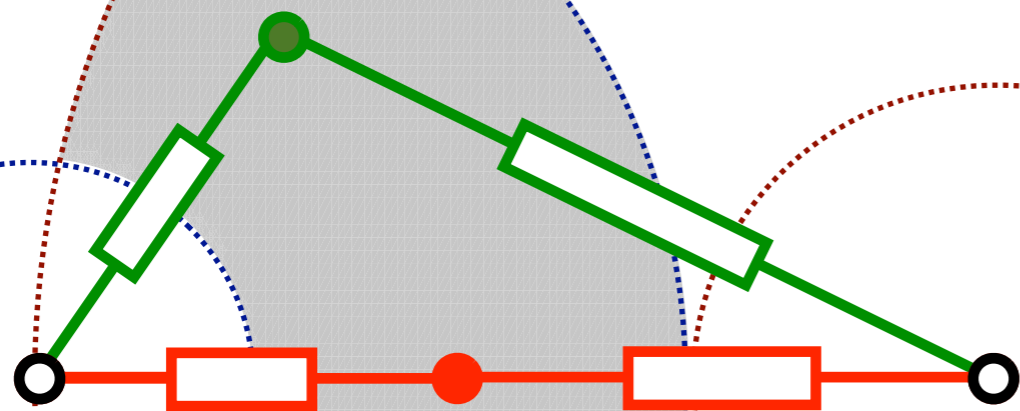

- Model:

$$f(u, x) = \begin{pmatrix} u_1^2 - (x_1^2 + x_2^2) \\ u_2^2 - ((x_1 - 9)^2 + x_2^2) \end{pmatrix} = 0$$

Example: 2-RPR Manipulator

- **Safe configuration**
- **Singular configuration**
 - Change of control variables \Rightarrow robot breakdown

Algebraic
characterization of
singularity:

$$\det D_x f(u, x) = 0$$

or

$$\det D_u f(u, x) = 0$$

Singularity Free Connected Components (SFCCs)

- Consider a manipulator modeled with $2n$ variables $(u, x) \in \mathbf{R}^{2n}$
- An **SFCC** is a set of boxes $[u] \times [x] \in \mathbf{IR}^{2n}$ that are
 - connected
 - not containing any **singular configuration**
 - proved to contain configurations
- **SFCC is an inner approximation of aspect**
 - Robot can move safely within the x projection of a given SFCC

Example: 2-RPR Manipulator

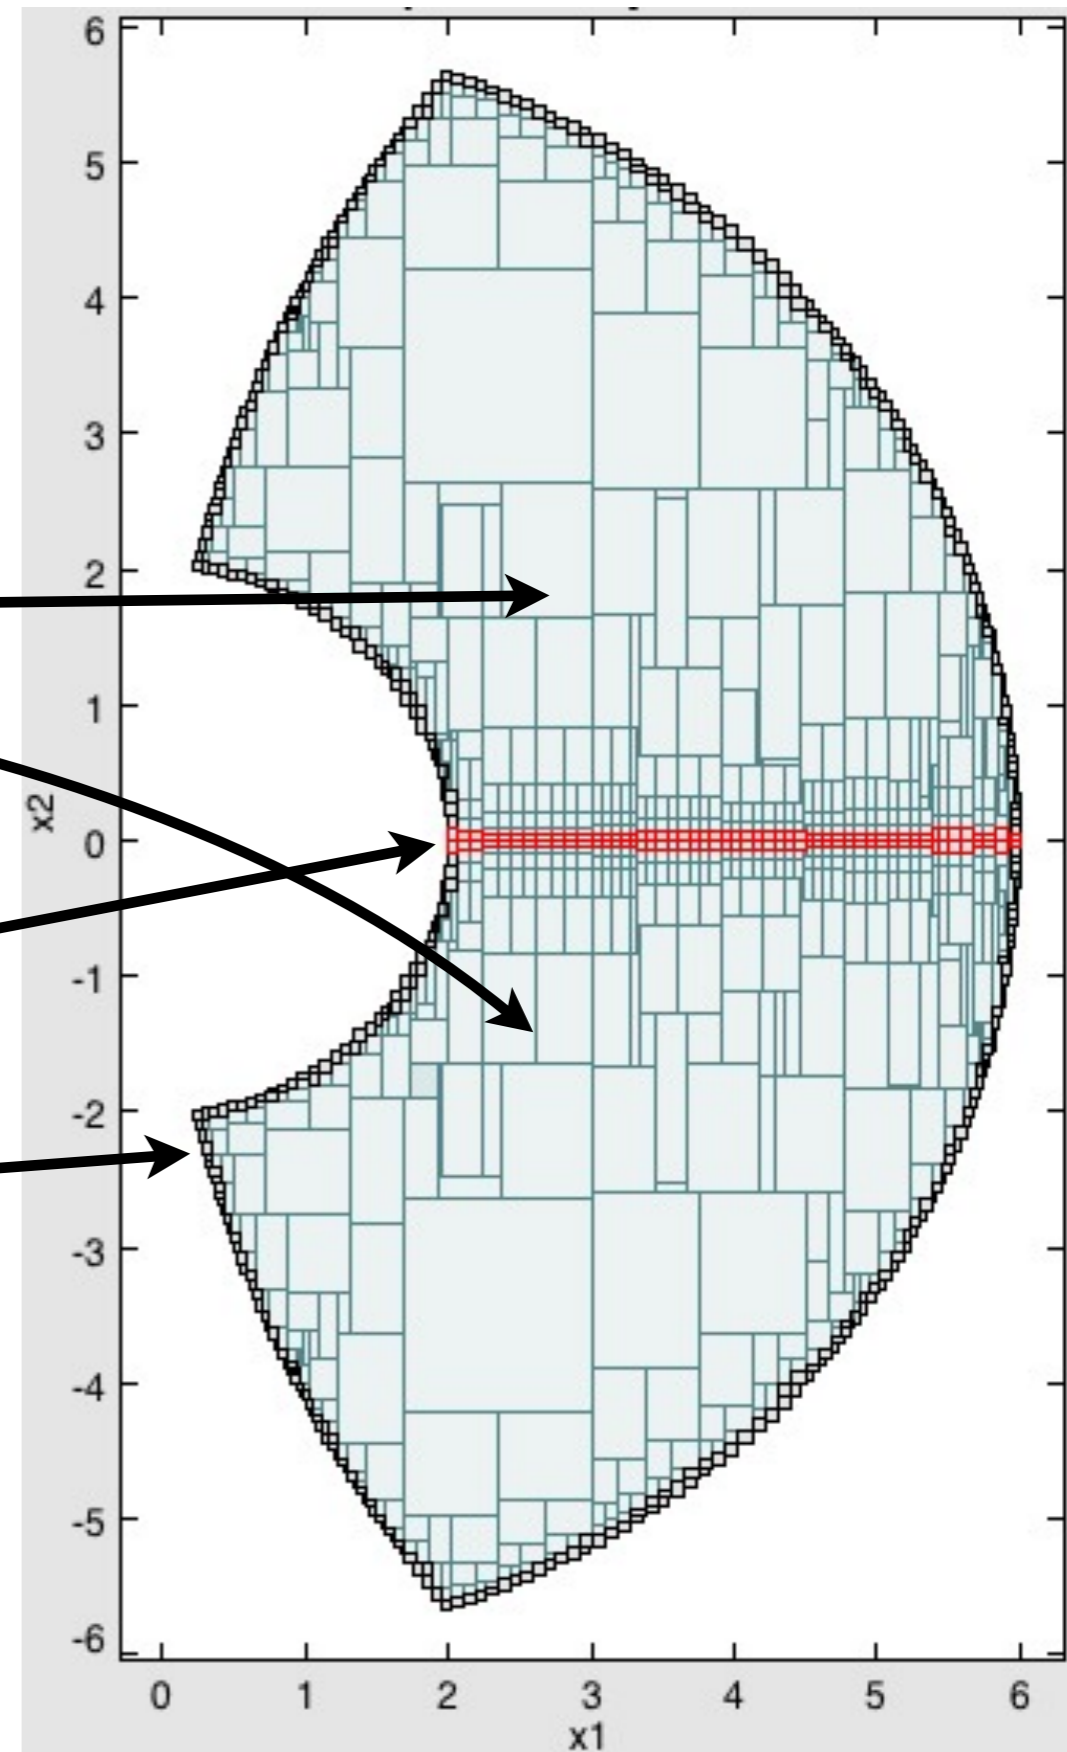

- Output:

- **2 SFCCs**

(projected on the workspace)

- **Possibly singular region**

- Uncertified reachable region

Example: RR-RRR

- 2-dimensional variables
- Initial domain:
 $u_i \in [-\pi, \pi]$,
 $x_i \in [-20, 20]$
- Model:

$$\begin{pmatrix} (x_1 - 8 \cos u_1)^2 \\ + (x_2 - 8 \sin u_1)^2 - 5^2 \\ (x_1 - 5 \cos u_2 - 9)^2 \\ + (x_2 - 5 \sin u_2)^2 - 8^2 \end{pmatrix} = 0$$

Example: RR-RRR

- Example of parallel singularity

Change of control variables
⇒ robot breakdown

$$\det D_x f(u, x) = 0$$

- Example of serial singularity

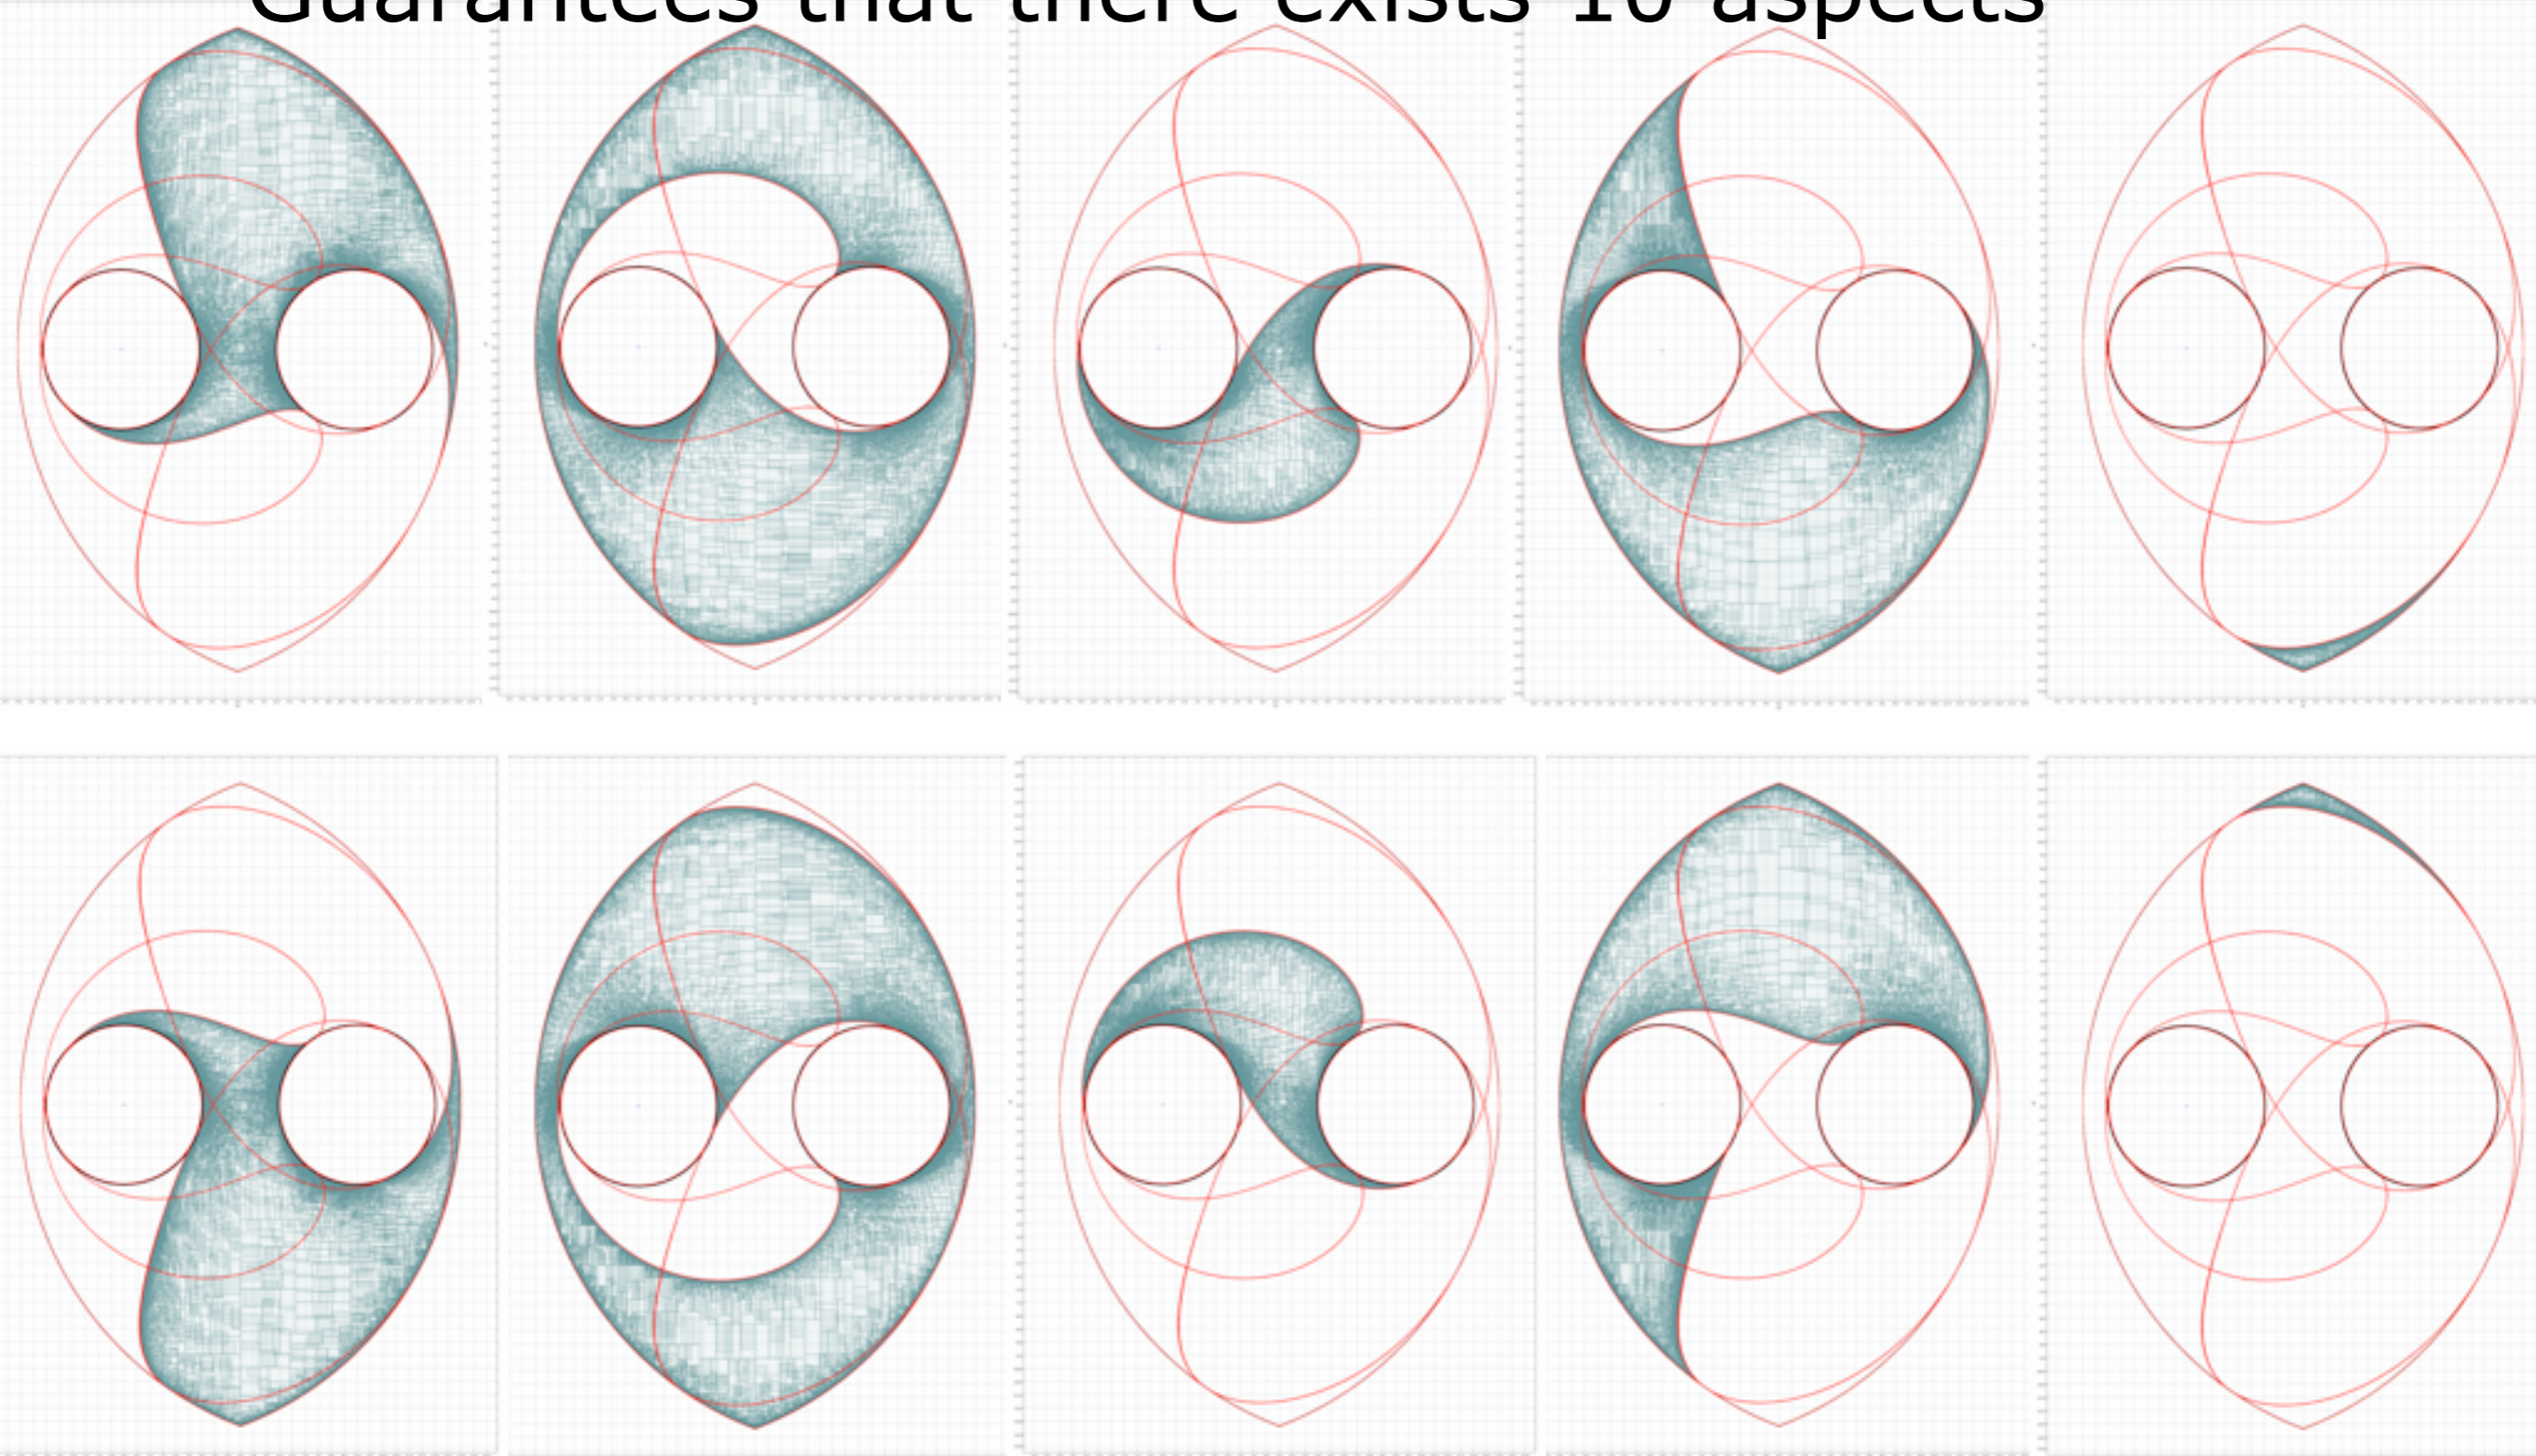

Change of pose variables
⇒ workspace limit

$$\det D_u f(u, x) = 0$$

Example: RR-RRR

- Computed 10 SFCCs:
 - Guarantees that there exists 10 aspects

Overview of the Proposed Method

Model, initial domain, precision

Solving process

Branch-and-Prune
framework

Existence proving
of solutions

Singularity
checking

Management of
neighboring boxes

Post process

Enumeration of connected components

SFCCs, singular regions,
uncertified regions

Visualization

Branch-and-Prune Framework

Prune

Branch

Prune

Existence Proof of a Configuration

- Consider boxes $[u] \times [x] \in \mathbf{IR}^{2n}$,

a continuously differentiable function $f : \mathbf{R}^{2n} \rightarrow \mathbf{R}^n$,

a real vector $\hat{u} \in [u]$, and

an interval Jacobian matrix $[J_u] \in \mathbf{IR}^{n \times n}$ that contains all

$D_u f(u, x)$ for $(u, x) \in [u] \times [x]$

derivative w.r.t. u

- Then, $\forall x \in [x] \exists u \in [u] (f(u, x) = 0)$, whenever

$$\hat{u} + \Gamma([J], ([u] - \hat{u}), f(\hat{u}, [x])) \subseteq \text{int}[u]$$

where $\Gamma([A], [v], [b])$ is the Gauss-Seidel operator

Existence Proof of a Configuration

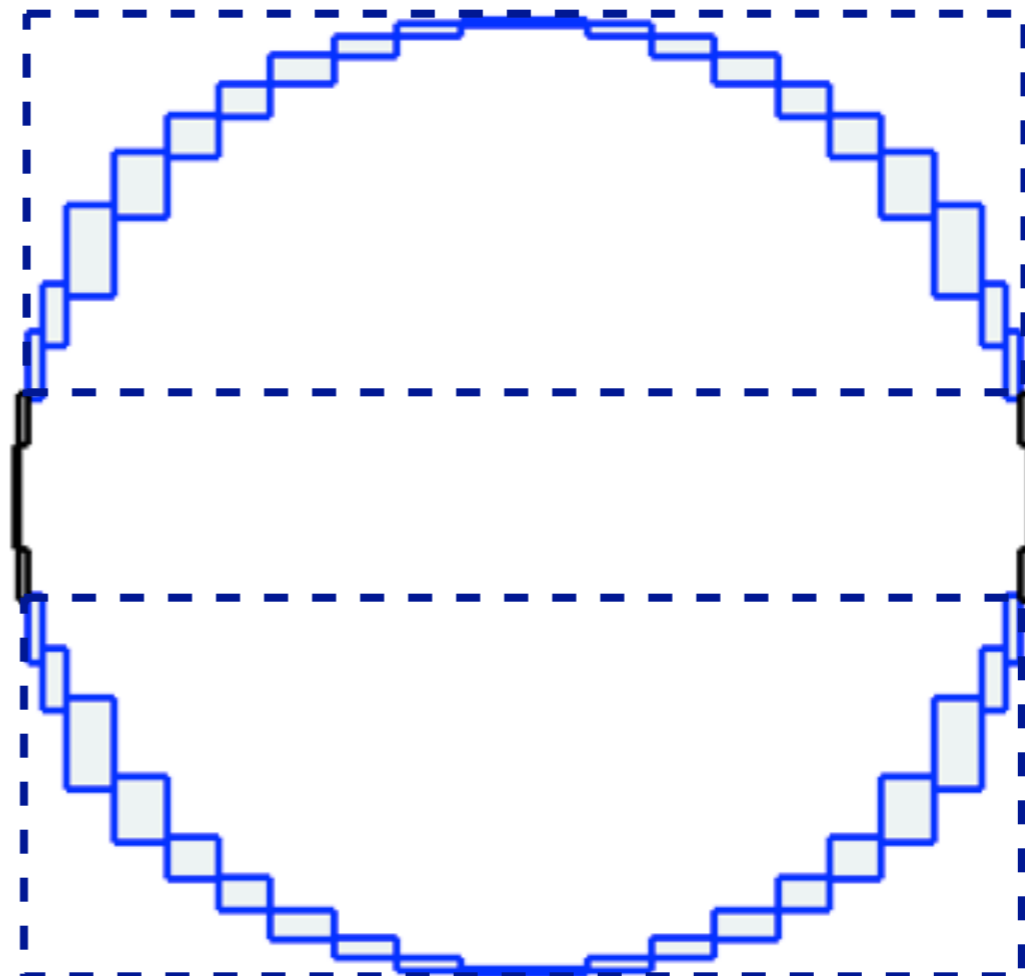

- Example:

- Model:

$$u^2 + x^2 - 1 = 0$$

- Computation result ($\varepsilon=0.2$):

Proved boxes
Unproved boxes

Singularity Checking

- Consider a manipulator modeled by $f(u,x)=0$, where $f : \mathbf{R}^{2n} \rightarrow \mathbf{R}^n$
- A configuration $(u,x) \in \mathbf{R}^{2n}$ exhibits
 - **serial singularity** iff $\det J_u = 0$
 - **parallel singularity** iff $\det J_x = 0$

where $J_u \in \mathbf{R}^{n \times n}$ is Jacobian w.r.t. u and

$J_x \in \mathbf{R}^{n \times n}$ is Jacobian w.r.t. x

Guaranteeing Regularity

- Interval of configurations $[u] \times [x] \in \mathbf{IR}^{2n}$ is **singularity free** if

$0 \notin [\det \mathbf{J}_u]$ and $0 \notin [\det \mathbf{J}_x]$ hold

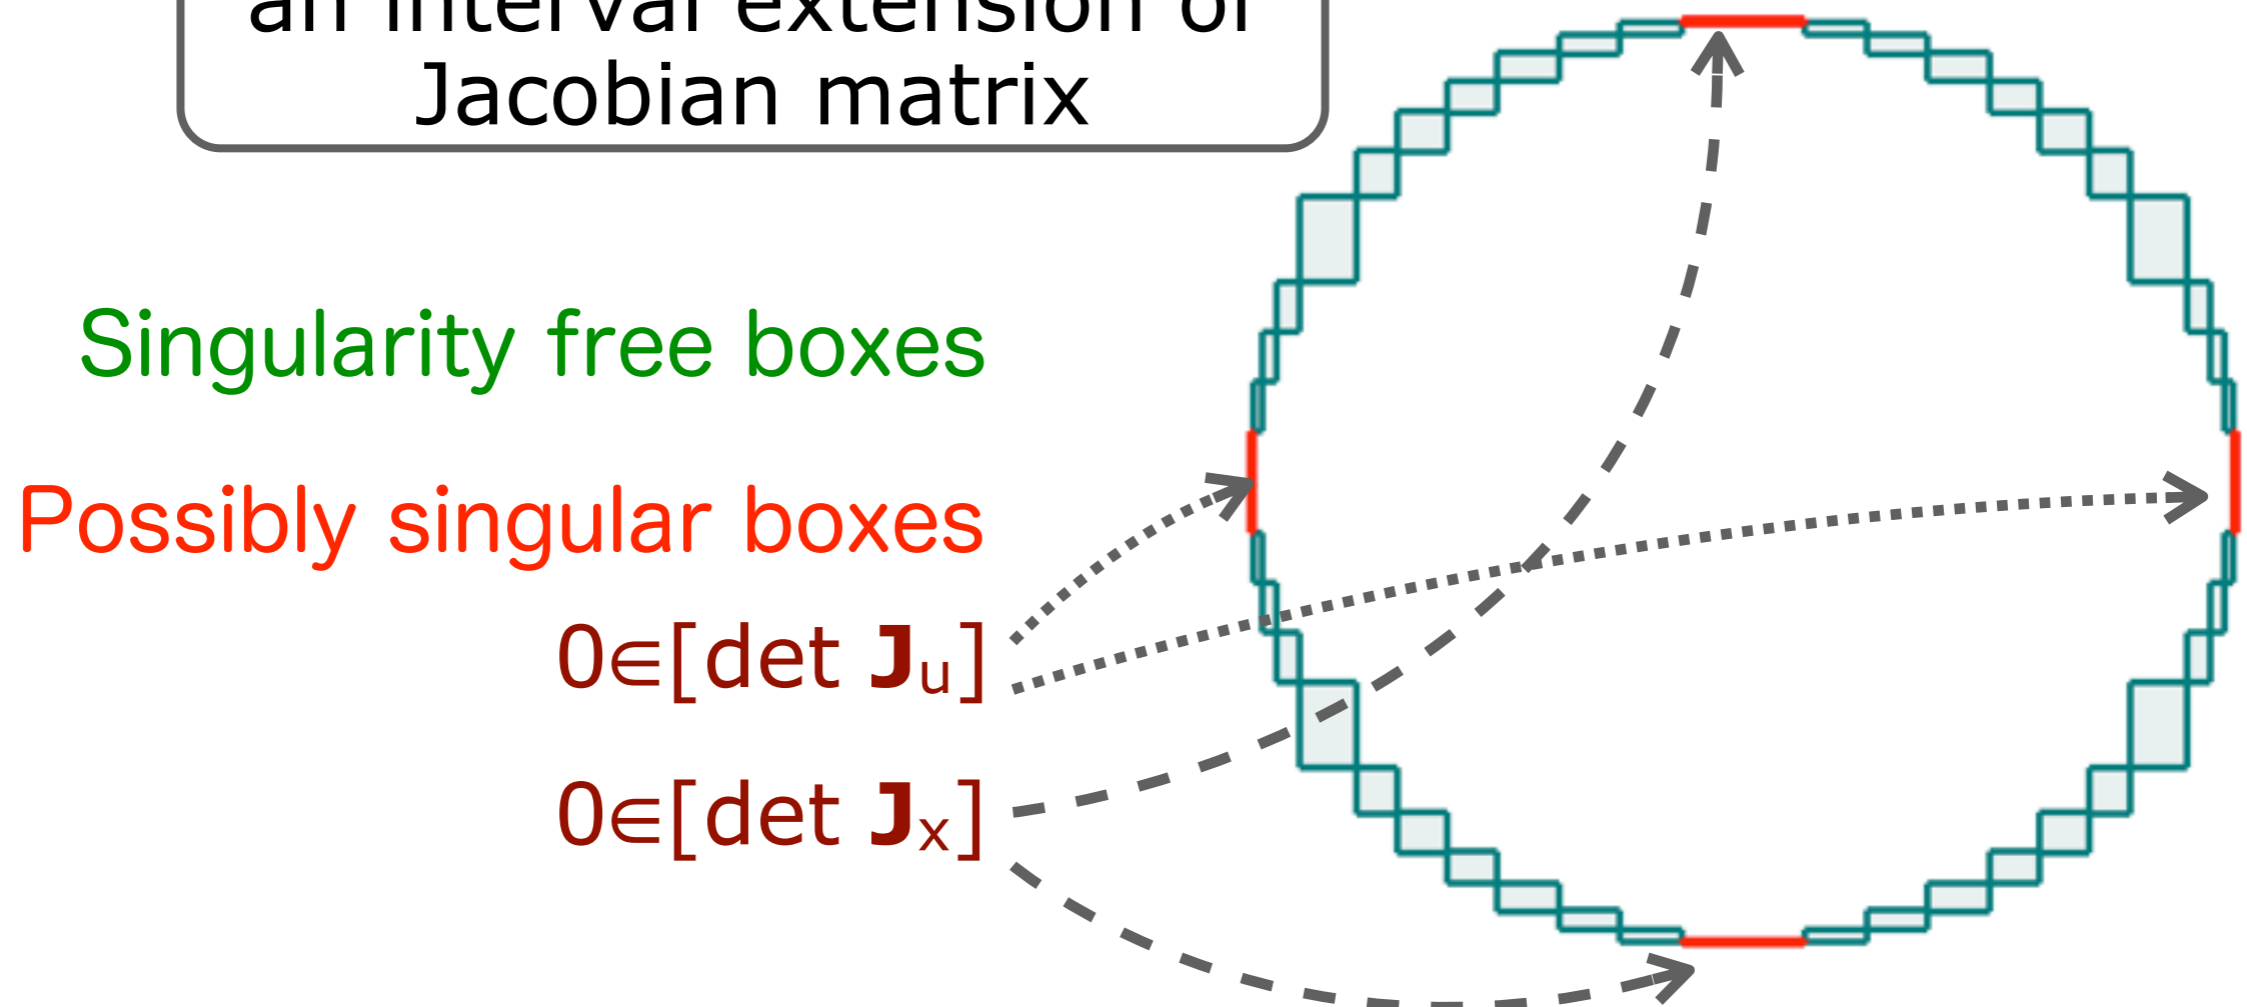

computed from
an interval extension of
Jacobian matrix

Singularity free boxes

Possibly singular boxes

$0 \in [\det \mathbf{J}_u]$

$0 \in [\det \mathbf{J}_x]$

Inner Testing

- A box $[u] \times [x] \in \mathbf{IR}^{2n}$ is contained in an aspect
 \Leftrightarrow existence proving succeeded
and singularity free check succeeded
- Using inner test as a search termination criterion
- Example: $x^2 + u^2 - 1 = 0$

Proved & SF boxes
Unproved & SF boxes
Possibly singular boxes

Overview of the Proposed Method

Model, initial domain, precision

Solving process

Branch-and-Prune
framework

Existence proving
of solutions

Singularity
checking

Management of
neighboring boxes

Post process

Enumeration of connected components

SFCCs, singular regions,
uncertified regions

Visualization

Enumeration of SFCCs

- Management of neighboring boxes during the search by Branch-and-Prune
- After the search, we apply a graph enumeration method to the set of inner boxes

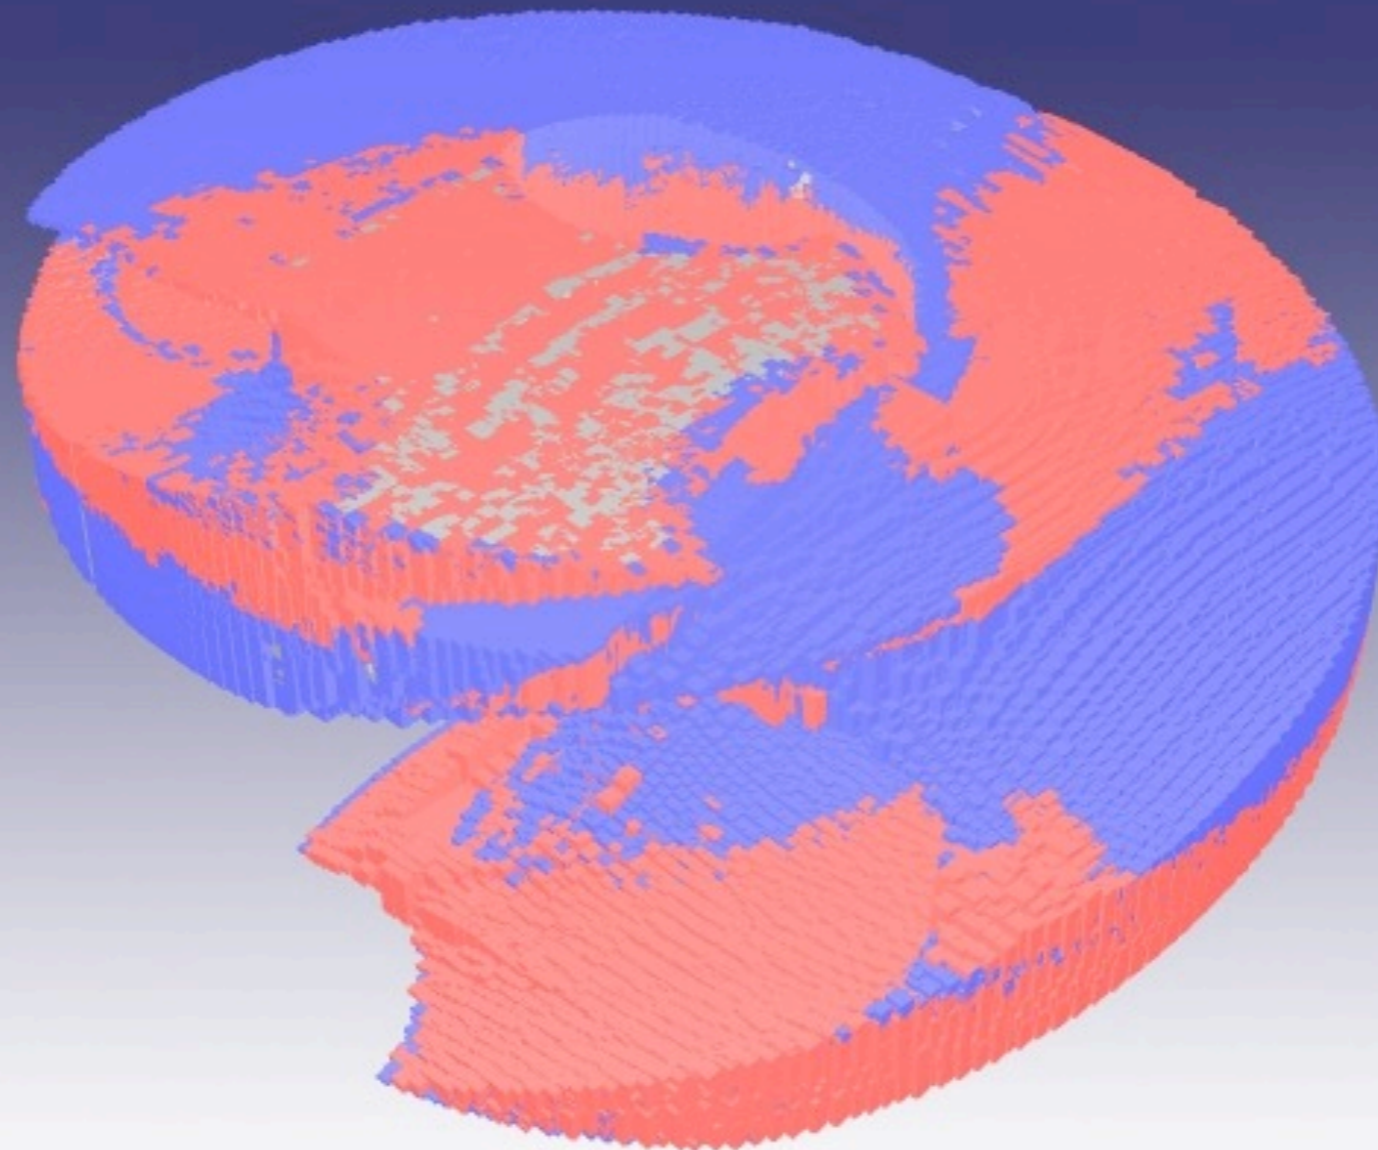

Example: 3-RPR

- 3 dimensional planer manipulator

Example: 3-RPR

- Computed spiral workspace:

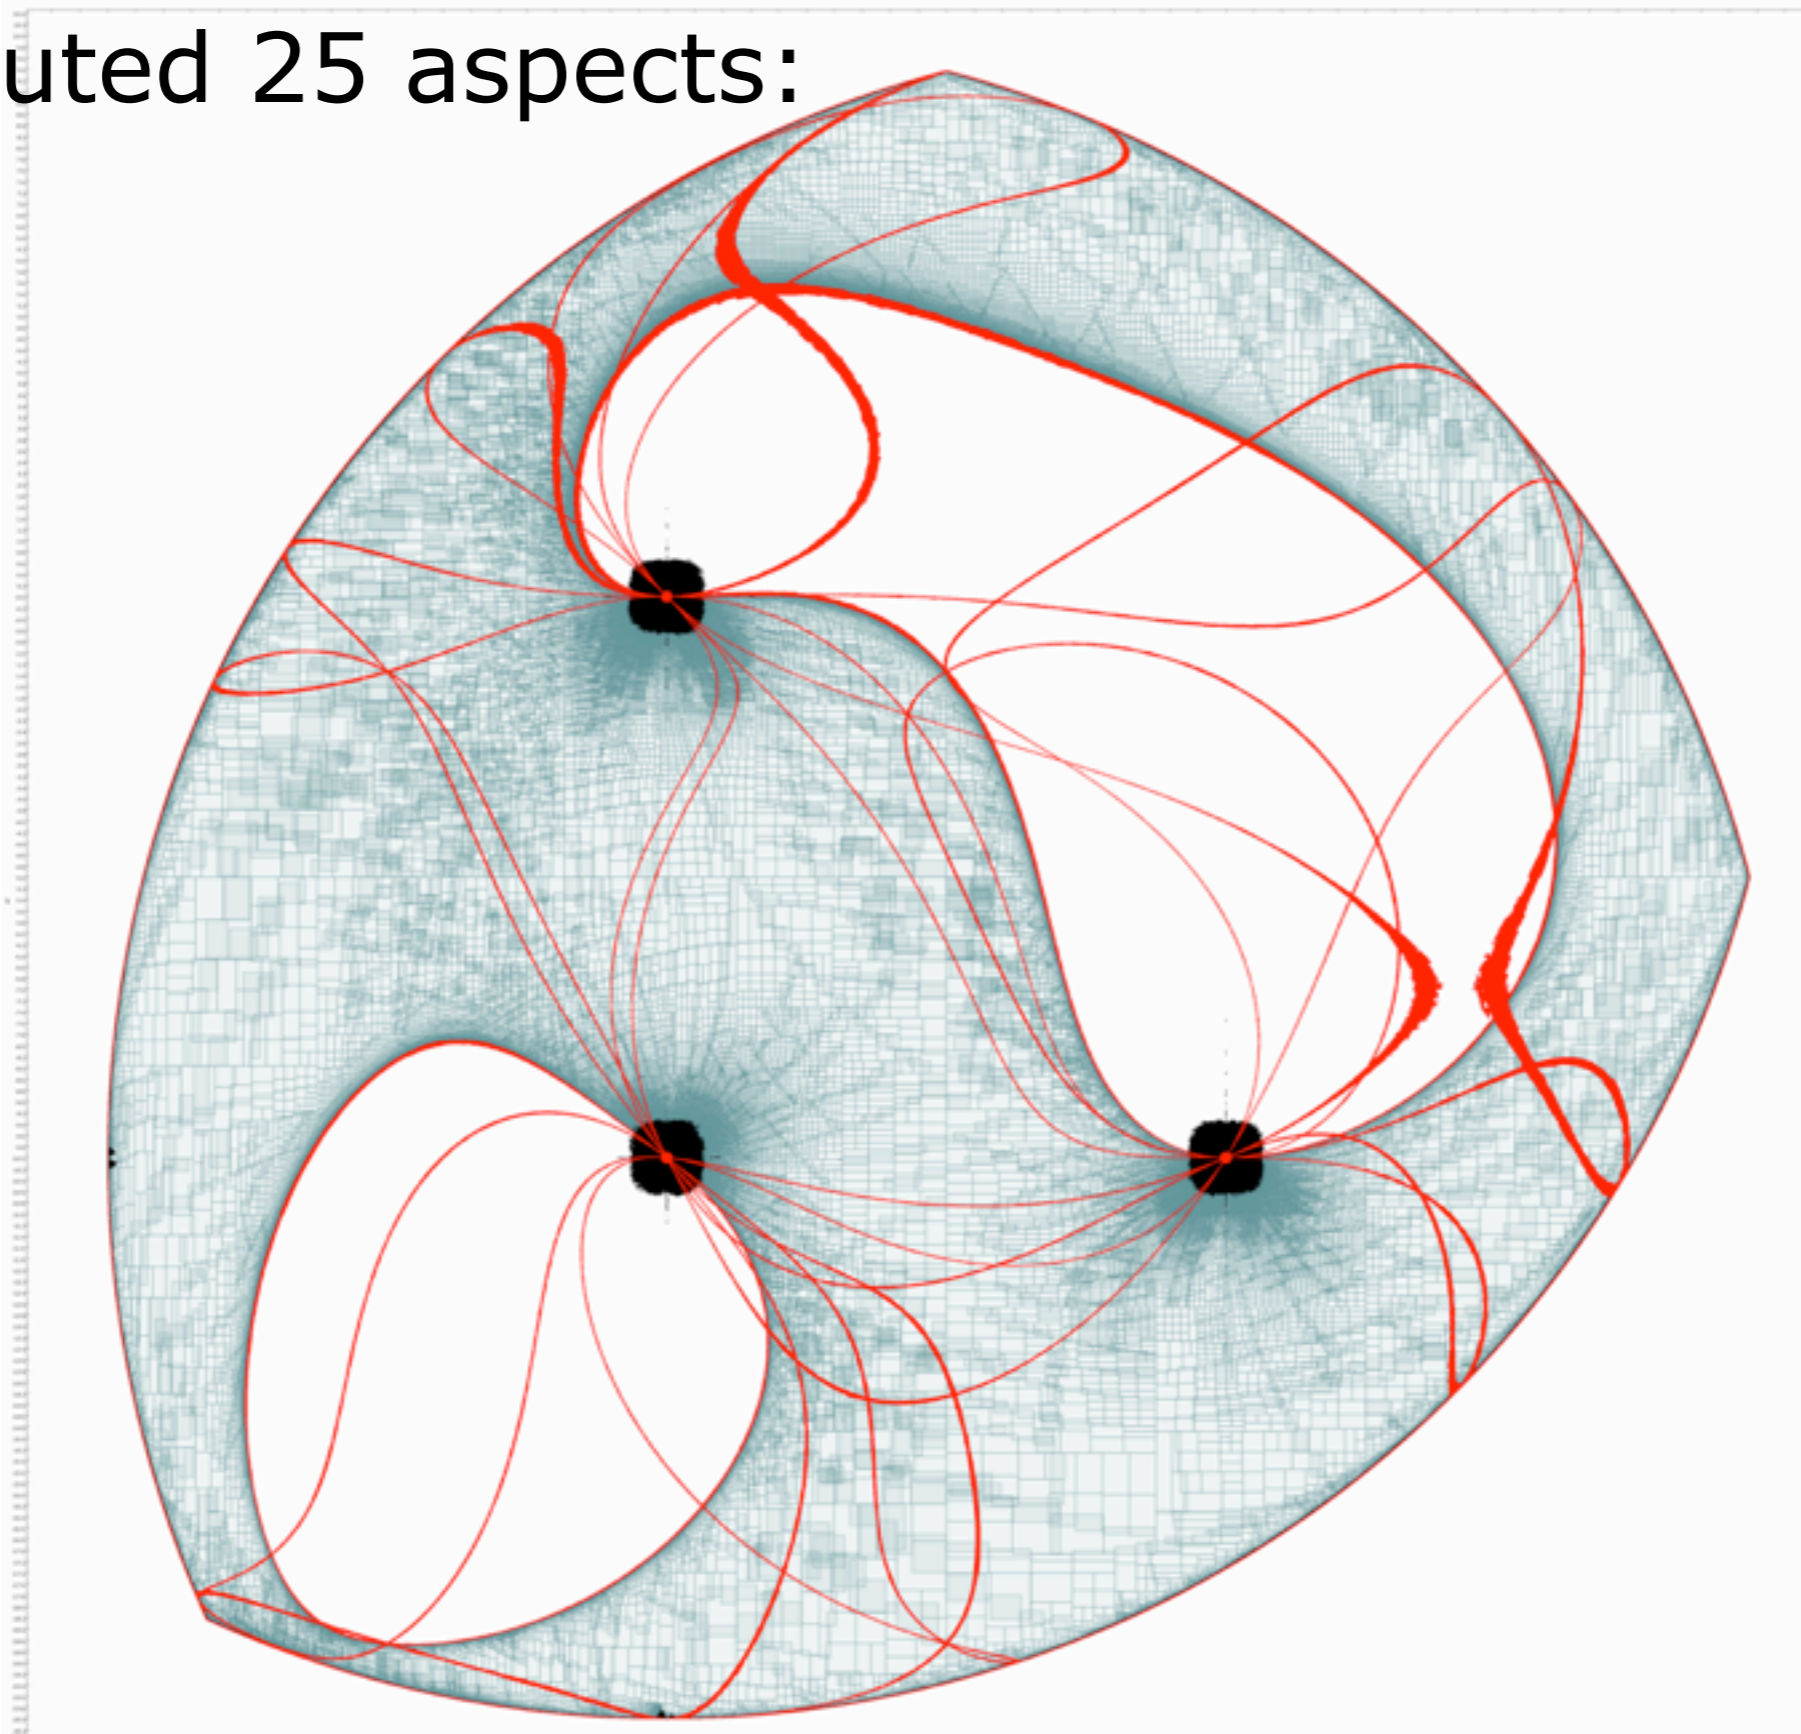

Example: 3-RRR

- Computed with fixed orientation: $x_3 = 0$

Example: 3-RRR

- Computed 25 aspects:

Experimental Results

	2-RPR	RRR	RR-RRR	3-RPR	3-RRR ($x_3=0$)
theoretical # aspects	2	2	10	2	?
prec	0.1	0.1	0.1	0.1	0.01
# SFCCs (filtered)	2	562 (2)	1456 (10)	49882 (2)	51901 (25)
# boxes	1240	31590	87584	13677836	6081438
time (s)	0.206	13.264	35.784	7913	5050

Conclusion

- We present a tool that supports
 - **simple modeling** of parallel manipulators
 - **validated computation** and **visualization** of workspace, working modes, and generalized aspects
- Experimental results indicate the correct number of generalized aspects
